

## Forklift Grapple

Forklift Grapple - Grapples work together with the crowning operation of the bucket cylinder situated on the excavator. They can mount directly onto the jib or any quick hitch that is in bucket position. Grapples are most often meant for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design offers the grapple with maximum strength and support by way of preventing the body from breaking and twisting through its function.

The grapple together with all of its moving parts are constructed of hardened steel. The pivot points are designed in order to ensure supreme closing force and holding ability. The operator has the capacity to deal with different sizes and varieties of materials because of the jaws fitted at the end part of the grapple with toes. This could enable the jaws to close through one another in a finger configuration for maximum handling capacity.
